So what exactly have we done?

You've got a list of features that Gary's game system framework needs to support, and that tells you all the major pieces of the system you need to build. This is a lot like the requirements list you built way back in Chapter 2 for Todd and Gina's dog door... except it focuses on the big picture.

Use a feature or requirement list to capture the BIG THINGS that your system needs to do.

Once you've got your features and requirements mapped out, you need to get a basic idea of how the system is going to be put together. Use cases are often too detailed at this stage, so a use case diagram can help you see what a system is like at 10,000 feet... kind of like a blueprint for your application.

Draw a use case diagram to show what your system IS without getting into unnecessary detail.
